

Talk to your books. Keep control of your business.

ERPCLaw is an AI-native ERP, free and open source, self-hosted. \$0 forever.

Ask in plain English. ERPCLaw reads the ledger to answer questions and performs business actions through conversation.

RECORDED ON SAMPLE BOOKS, 9 OCTOBER 2026

Know what is due

In the recorded example, ERPCLaw found Acme's \$2,500 invoice, due 31 October, with nothing overdue. The read changed no books.

Record the payment correctly

Acme paid \$2,450 and took a \$50 discount. After confirmation, ERPCLaw posted three balanced ledger lines and marked the \$2,500 invoice paid.

Keep an unmatched bill out of the ledger

Northfield billed \$12,600 for 300 cartridges. With none received, ERPCLaw refused the purchase-order-linked bill. Nothing posted.

Each change in this example left a timestamped entry.

AI-native from the start.

ERPCLaw was built for AI agents from its first commit. The ledger rules govern what can post.

When comparing with QuickBooks Online by Intuit or NetSuite by Oracle, ask whether AI is the operating interface or an assistant added to an existing system. Compare ownership, posting controls and the work your business needs.

Your database stays on your machine or server. SQLite is the default. PostgreSQL fully supported.

Open source under GPLv3. No licence tiers or per-seat charges. Patent pending.

See it work, then follow the installation guide.
